Understanding the Basics of Organic Chemistry

What are the Hybridizations of Common Organic Molecules?

- **sp³ hybridization:** Seen in alkanes (e.g., methane, CH₄), where carbon forms four sigma bonds.
- **sp² hybridization:** Present in alkenes (e.g., ethene, C₂H₄) and aromatic compounds like benzene.
- **sp hybridization:** Found in alkynes (e.g., acetylene, C₂H₂), where carbon forms two sigma bonds and two pi bonds.

How to Determine the Hybridization of a Carbon Atom?

- Count the number of sigma bonds and lone pairs attached to the atom.
- If the atom is bonded to four atoms/groups, hybridization is **sp³**.
- If bonded to three atoms/groups with one double bond, hybridization is **sp²**.
- If bonded to two atoms/groups with one triple bond or two double bonds, hybridization is **sp**.

Reactions and Mechanisms

What are the Key Types of Organic Reactions?

- **Addition reactions:** Atoms or groups add to a double or triple bond (e.g., hydrogenation, halogenation).
- **Elimination reactions:** Remove atoms or groups, forming a double or triple bond (e.g., dehydrohalogenation).
- **Substitution reactions:** One atom or group is replaced by another (e.g., nucleophilic substitution).
- **Rearrangement reactions:** Structural rearrangements within a molecule (e.g., carbocation rearrangements).

How to Predict the Product of a Nucleophilic Substitution Reaction?

- Identify whether the substrate is primary, secondary, or tertiary.
- Determine whether SN1 or SN2 mechanism applies based on the substrate and conditions:
- SN2 is favored by primary substrates, strong nucleophiles, and polar aprotic solvents.
- SN1 is favored by tertiary substrates, weak nucleophiles, and polar protic solvents.
- Consider stereochemistry: SN2 causes inversion (Walden inversion), while SN1 may lead to racemization.

Isomerism in Organic Chemistry

What are Structural Isomers and Stereoisomers?

- **Structural isomers:** Differ in the connectivity of atoms (e.g., butane and isobutane).
- **Stereoisomers:** Have the same connectivity but differ in spatial arrangement (e.g., cis- and trans- isomers).

Explain Geometric Isomerism (cis/trans) with Examples

- Occurs in alkenes where restricted rotation prevents free rotation around double bonds.
- **cis-isomer:** Substituents are on the same side of the double bond.
- **trans-isomer:** Substituents are on opposite sides.
- Example: *But-2-ene*: cis-but-2-ene and trans-but-2-ene.

What is Optical Isomerism and Chirality?

- Optical isomers are non-superimposable mirror images known as enantiomers.
- Chirality arises when a carbon atom has four different substituents.

- Enantiomers rotate plane-polarized light in opposite directions.
- Optical activity is measured using a polarimeter.

Important Organic Reactions and Their Conditions

What are the Conditions for the Hydrolysis of Esters?

- Requires acid or base catalysis.
- **Acid hydrolysis:** Uses dilute HCl or H₂SO₄.
- **Base hydrolysis (Saponification):** Uses NaOH or KOH, producing soap and alcohol.

How Does the Electrophilic Aromatic Substitution Work?

- The aromatic ring acts as a nucleophile, reacting with an electrophile.
- Electrophile attacks the ring, forming a sigma complex (arenium ion).
- Deprotonation restores aromaticity.
- Substituents influence the position of substitution (ortho/para-directing or meta-directing).

What Are the Key Factors Influencing Substitution Reactions?

- Nature of the electrophile or nucleophile.
- Type of substrate (aryl, alkyl, vinyl).
- Reaction conditions (temperature, solvent).
- Presence of catalysts or directing groups.

Organic Synthesis and Strategies

How to Synthesize an Alcohol from an Alkene?

- Use acid-catalyzed hydration (H₂SO₄ and H₂O).
- Markovnikov's rule applies: the H attaches to the carbon with more hydrogens, and OH attaches to the other.
- For anti-Markovnikov, use hydroboration-oxidation.

What are the Main Methods for Aromatic Substitution?

- Electrophilic substitution.
- Examples include nitration, sulfonation, halogenation, and Friedel-Crafts alkylation/acylation.
- Reaction conditions vary depending on the electrophile and desired substitution pattern.

How to Perform a Reduction of Ketones and Aldehydes?

- Use reducing agents like NaBH_4 or LiAlH_4 .

Deep Dive into Sample Questions and Their Solutions

Sample Question 1: Nucleophilic Substitution

Question:

Explain the mechanism of S_N2 reaction of methyl bromide with hydroxide ion, including electron flow and stereochemical considerations.

Analysis:

- Mechanism:
 - Nucleophile (OH^-) attacks the electrophilic carbon from the opposite side of the leaving group (bromide).
 - Simultaneously, the C-Br bond breaks, and Br^- departs.
 - The process occurs via a single transition state—a backside attack leading to inversion of configuration if chiral centers are involved.

- Electron Flow:

Curved arrows depict lone pair electrons attacking the carbon and bond cleavage from the carbon to bromide.

- Stereochemical Implication:

For methyl bromide (which is not chiral), stereochemistry is not a concern. However, if a chiral substrate were involved, SN2 would lead to inversion.

Educational takeaway:

Understanding this fundamental SN2 mechanism is crucial, as it underpins many reaction pathways in organic chemistry.

Sample Question 2: Stereochemistry and Chirality

Question:

Draw all possible stereoisomers of 2,3-dibromobutane and determine how many are optically active.

Analysis:

- Step 1:

Identify stereogenic centers: carbons 2 and 3 are attached to bromines and hydrogens.

- Step 2:

Number of stereoisomers: 2^n , where $n = 2$ (number of stereogenic centers), so 4 stereoisomers.

- Step 3:

Draw the stereoisomers:

- (2R,3R)

- (2S,3S)
- (2R,3S)
- (2S,3R)

- Step 4:

Among these, the meso form exists when the molecule has an internal plane of symmetry, which occurs in the (2R,3S) and (2S,3R) pair, forming a meso compound.

- Step 5:

Result:

- Total stereoisomers: 4
- Optical activity: The enantiomeric pairs (2R,3R) & (2S,3S) are optically active; the meso form is optically inactive.

Educational significance:

This exercise enhances understanding of stereoisomerism, chirality, and optical activity.
