Practical Examples Demonstrating the New Trend Mathematics M2 Solution

Example 1: Optimization Problem

Find the maximum value of the function $f(x) = x^3 - 6x^2 + 9x + 2$ for real x .

Traditional Approach:

- Take derivative $f'(x) = 3x^2 - 12x + 9$.
- Solve $f'(x) = 0$ to find critical points.
- Analyze second derivative or use test points.

New Trend Approach:

- Visualize $f(x)$ with a graph to identify the approximate location of maxima.
- Use derivative analysis combined with graphing tools to confirm.
- Recognize that $f'(x)$ factors as $3(x^2 - 4x + 3) = 3(x-1)(x-3)$.
- Critical points at $x=1$ and $x=3$.
- Plug into $f(x)$:
- $f(1) = 1 - 6 + 9 + 2 = 6$
- $f(3) = 27 - 54 + 27 + 2 = 2$
- Since $f(1) > f(3)$, the maximum is at $x=1$, with a value of 6.

Insight:

Using visualization alongside algebra simplifies identifying the maximum point.

Example 2: Geometric Series Analysis

Determine the sum to infinity of the series $(S = \sum_{n=1}^{\infty} \frac{2^n}{3^n})$.

Traditional Approach:

- Recognize geometric series with ratio $(r = \frac{2}{3})$.
- Sum to infinity is $(\frac{a}{1 - r})$, where (a) is the first term.

New Trend Approach:

- Visualize the series as a geometric progression.
- Use software to plot partial sums and observe convergence.
- Confirm the sum:

$$S = \frac{\frac{2}{3}}{1 - \frac{2}{3}} = \frac{\frac{2}{3}}{\frac{1}{3}} = 2$$

- Visual confirmation through plotting partial sums approaching 2.
